

## **POLLUTION**

In just reading back on some of the previous headings and comments – pollution is there and all around us.

By tackling health issues then pollution will be controlled better;

Renewable energy assists in the reduction of fossil fuel burning;

Conservation brings down pollution through more careful and thoughtful control of materials and methods of disposal.

Reducing pollution in the work place is essential and a 'hot potato' with Environmental Departments and Officers.

During your weekly 'walkabout' have a check on dust – the band of particles in an office where a sun beam has entered is a clear indication of the amount of dust there (plus pollution from sun glare to the operatives!) – have a clean up session, empty the vacuum and clean the filter to stop all the particles collected going straight out the rear end!!

## **WASTE CONTROL**

If you've got this far – then well done!

If you've got this far and have decided to 'do' something more about the subject – then very well done!

If you've got this far and think the whole subject is 'much ado about nothing' – then go away!

Control of waste product should be a management tool in the efficient running of any business – whether an office, a shop, a workshop or a factory – the way that waste products are 'moved on' or disposed off correctly is an environmental issue and can be a good earner in the long term – or an expensive cost if not thought through and tackled.

I leave your expertise to you in finding new ways of getting away your own waste in a professional manner – use and study your competition – how do they get the waste away efficiently?

Your own trade magazines will have adverts and details / information etc on specialist removers and recyclers of waste chemicals, oils and materials.

Just think on and, more importantly, act on!

That's it – I've had my 'crack' at the subject as promised – having just scratched the surface I have to move the subject and the control over and into your lap – and the best of luck!!

Don't lose sight of safety issues, though, as the idiots are still out there – as usual!

Remember the iron as a grill in my last newsletter – now found as a kettle boiler!!

Overloading around the World – when I said “recycling” I did not mean this!!

*Be Safe out There!!*

*Jerry*
